Version: 1.2

Configuration de la borne Wifi

Un fois sur l'interface Web de la borne il faut configurer la borne avec une IP statique.

Choisir le fuseau horaire et le protocole NTP

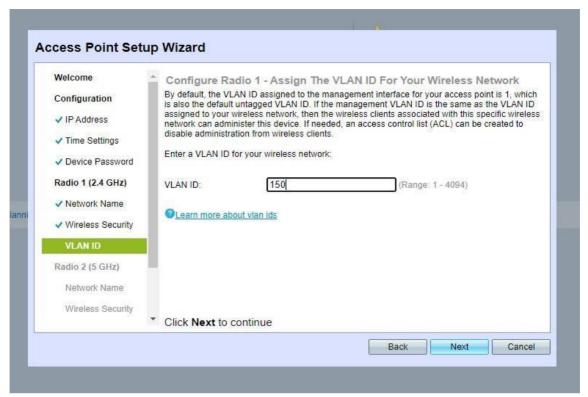

Mettre le mot de passe administrateur de la borne.

Mettre le SSID Administrateur avec sa clé de sécurité

Entrer le numéro du VLAN administrateur de votre Wifi dans votre réseau

Refaire la même chose pour la Radio en 5 GHz.

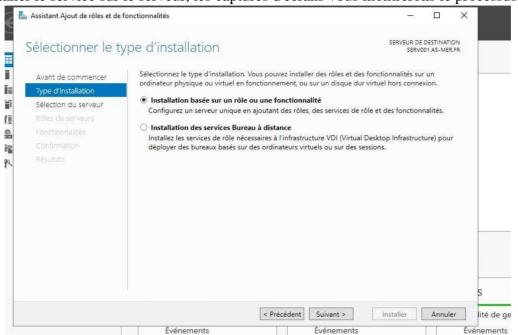

Il faut ensuite créer les différents SSID que vous voulez.

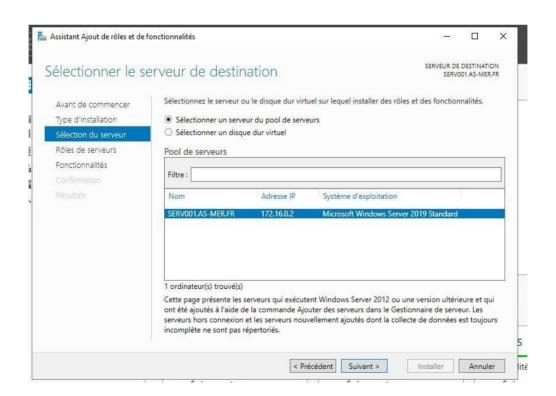

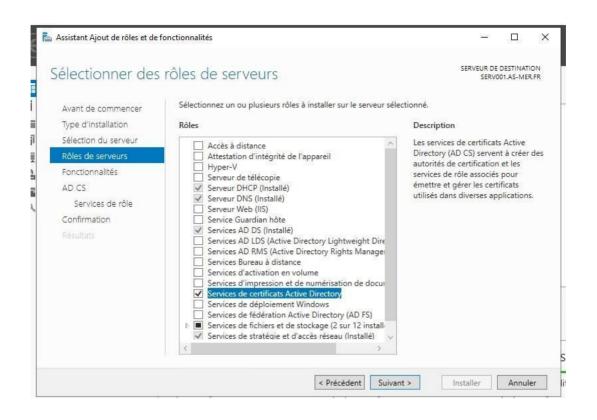

Si vous n'avez pas de service Radius, il faut mettre la sécurité WPA Personnel et rentrer la clé de sécurité de chaque SSID.

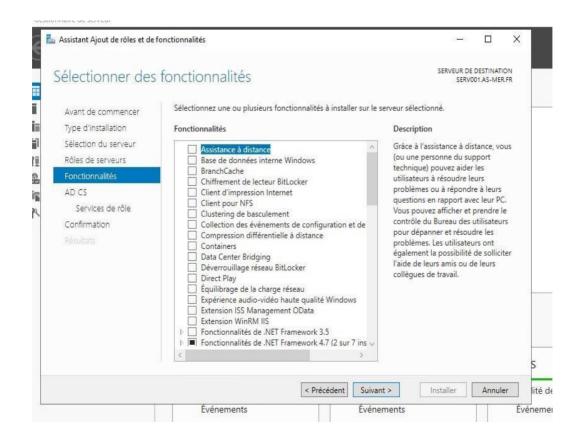

Configuration du Service Radius

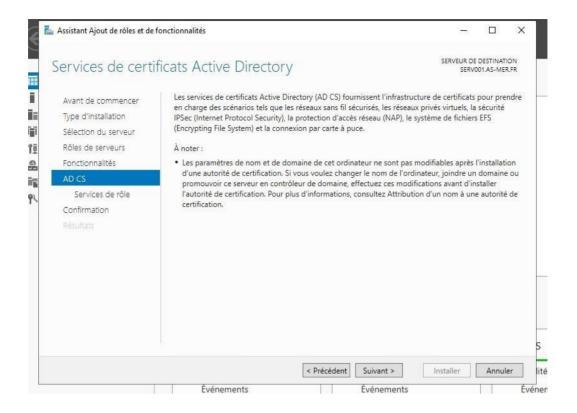

Il faut installer le service sur le serveur, les captures d'écrans vous montrerons le processus.

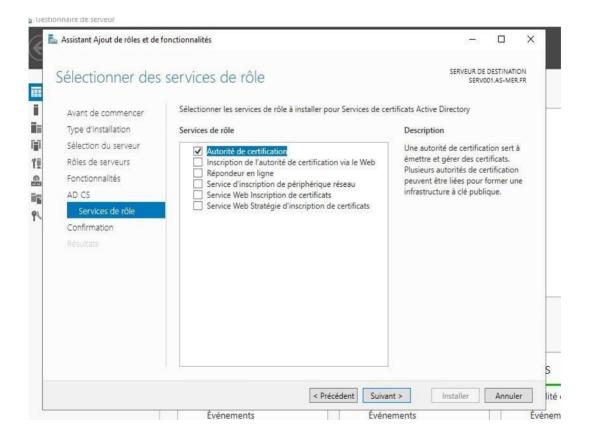

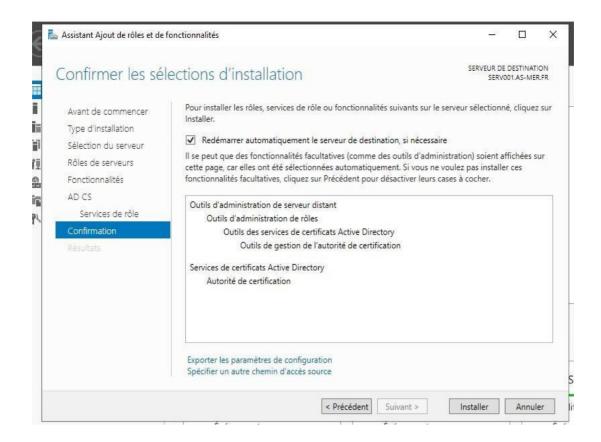

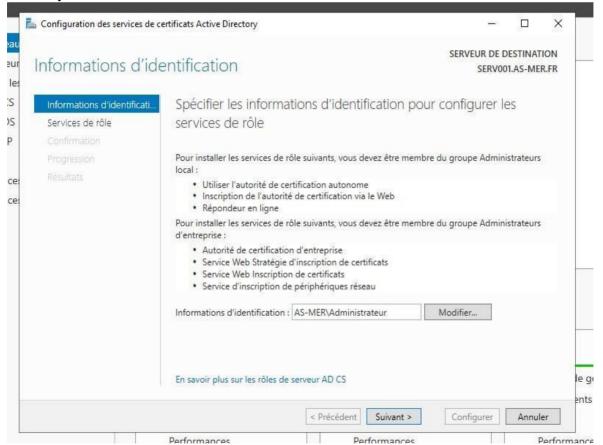

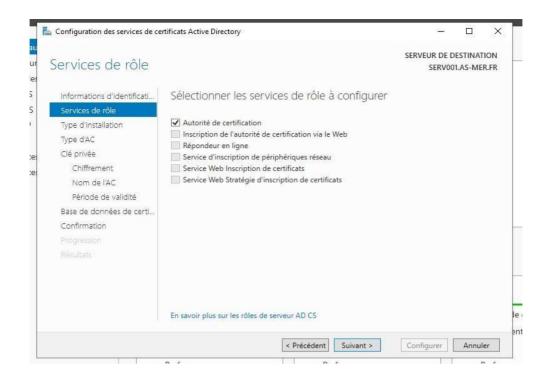

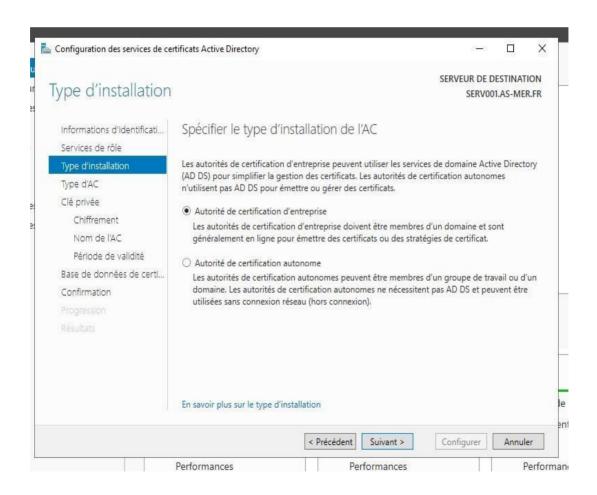

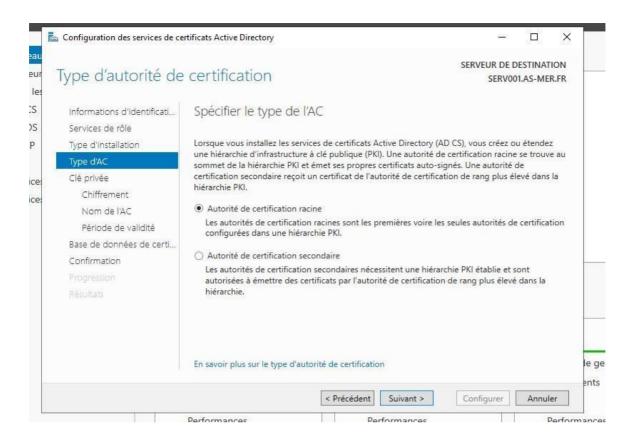

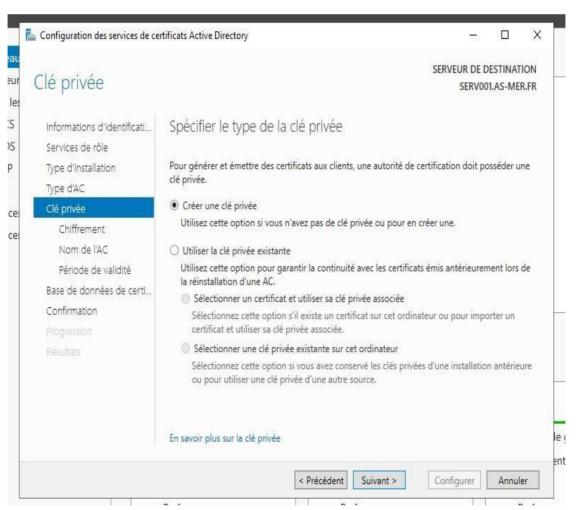

Après installation et redémarrage du service, il faut configurer les service de certificats Active Directory.

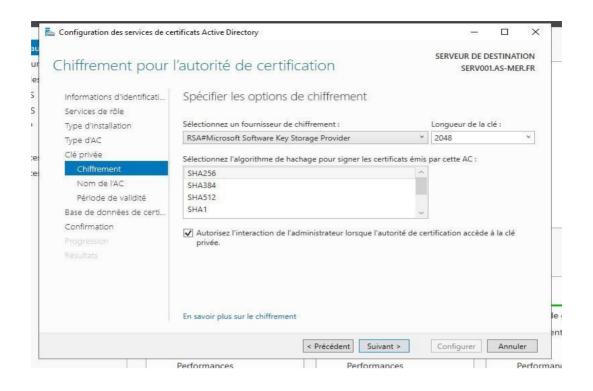

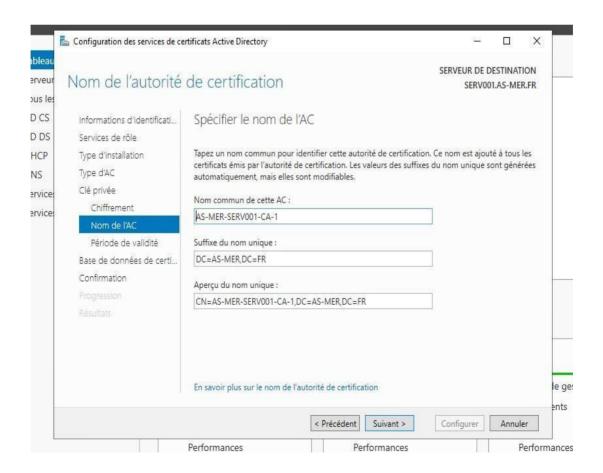

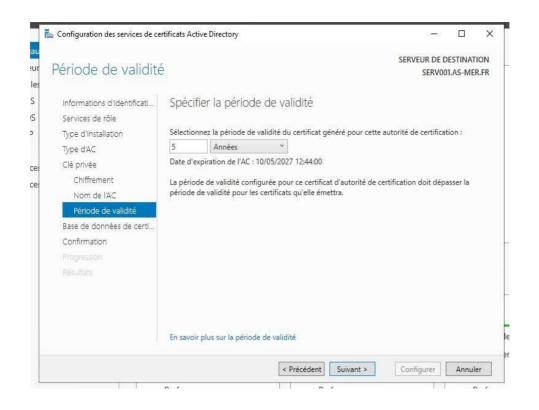

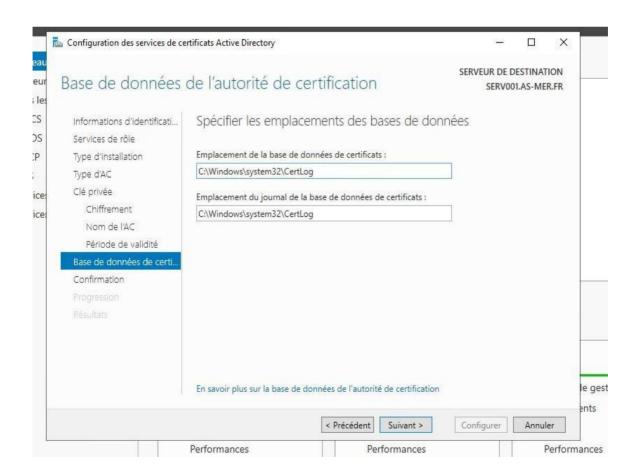

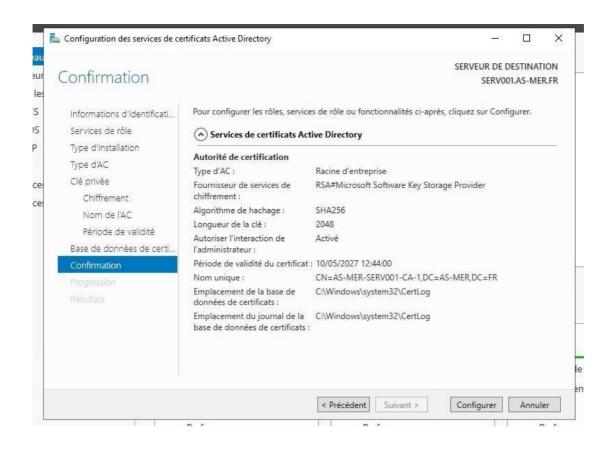

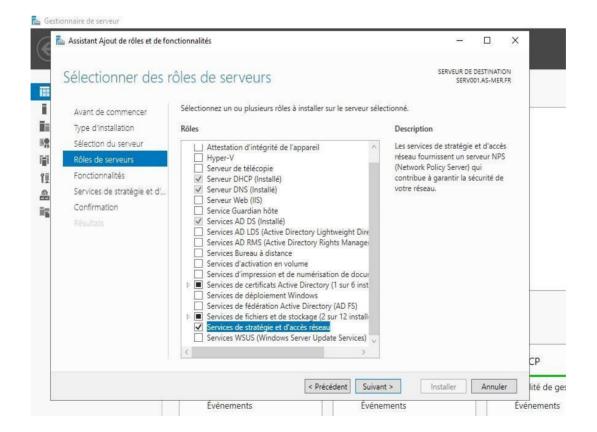

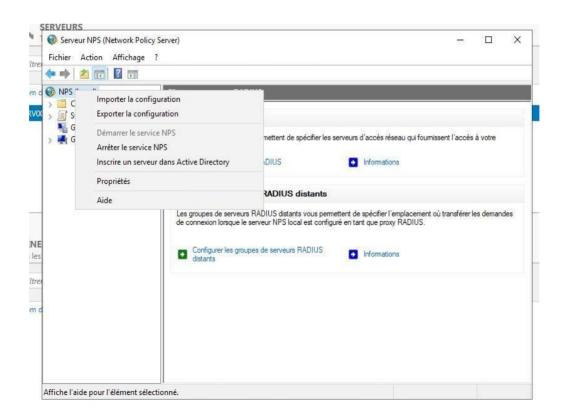

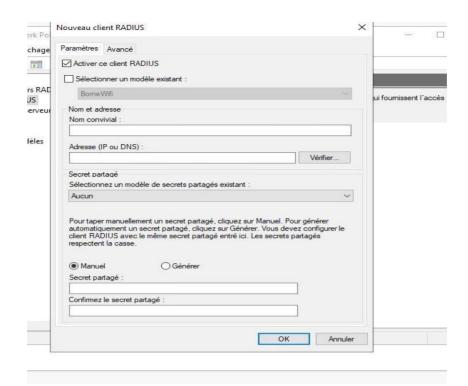

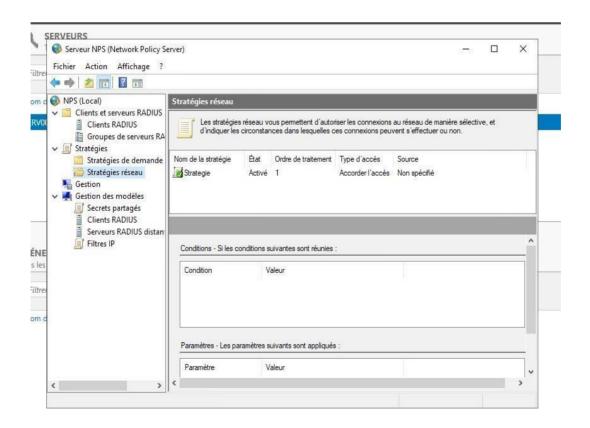

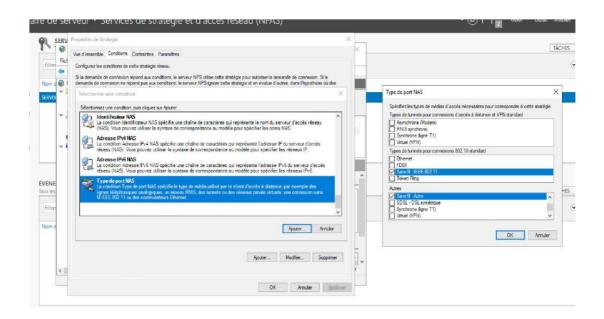

Passons maintenant à la configuration du service NPS

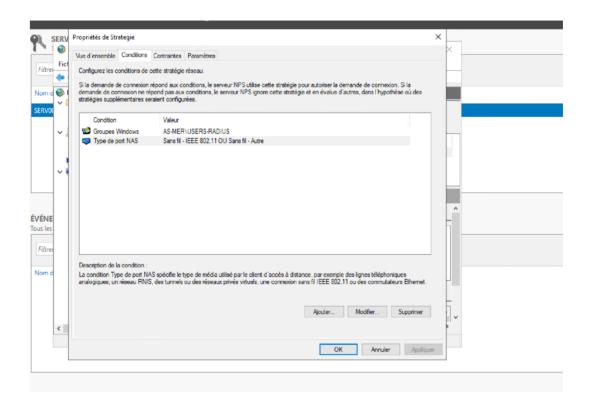

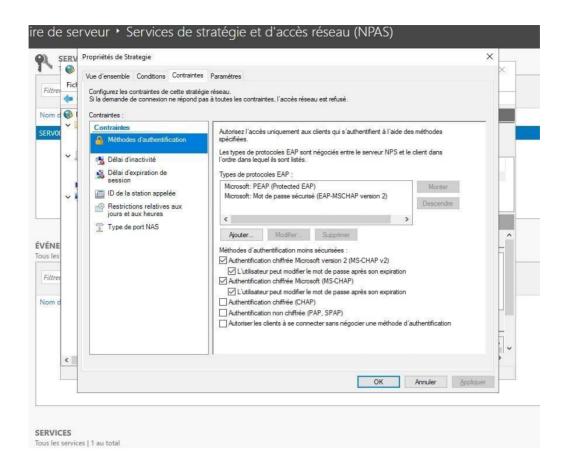

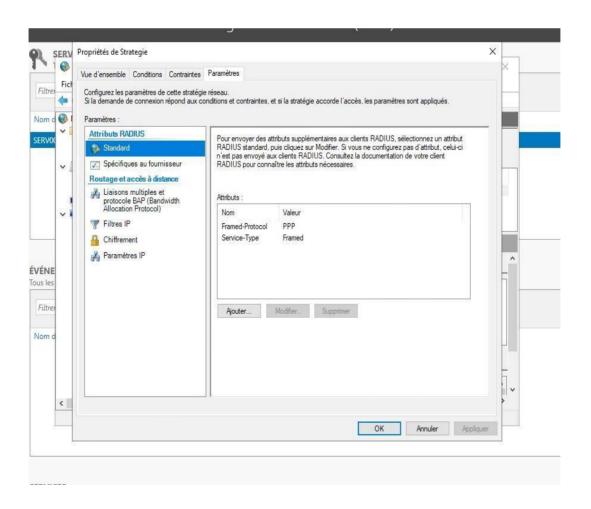

Un fois la configuration du service Radius terminée, il faut modifier la sécurité sur les SSID.
